Paleontology is the study of the history of life on Earth as based on fossils. Fossils are the remains of plants, animals, fungi, bacteria, and single-celled living things that have been replaced by rock material or impressions of organisms preserved in rock. Paleontologists use fossil remains to understand different aspects of extinct and living organisms.

Scientists have found that the impact of human activity on land has exacerbated the spread of *Cryptococcus gattii*, threatening the lives of marine mammals and humans.. In the early 2000s, hundreds of animals and people in British Columbia (Canada) and Washington State (USA) acquired a fungal infection that was also known to have killed marine wildlife, possibly even earlier than humans.

Introduction Contemporary risk assessment tools categorise patients with pulmonary arterial hypertension (PAH) as low, intermediate, or high-risk. A minority of patients achieve low-risk status with most remaining intermediate-risk. Our aim was to validate a 4-strata risk assessment approach categorising patients as low, intermediate-low, intermediate-high, or high risk, as proposed by the ...
