specific influence on human brain asymmetry, an RS + gene present in some but not all people, that induces advantage for the left hemisphere by weakening the right hemisphere. The theory explains associations between handedness and cerebral specialisation for speech, and also handedness in families and twin pairs.

Handedness represents one form of functional hemispheric asymmetries—e. g., left-right differences in the brain. Specifically, in left-handers, the motor cortex in the right side of the brain (the...

Handedness (left, right), brain asymmetry (left, right), and sex (male, female) served as between-group factors. Separate analyses were performed for the FO and PT measures of brain asymmetry. For FO, the MANOVA revealed a significant 2-way interaction between handedness and brain asymmetry,  $F_{6,47} = 2.45, P <$

Handedness reflects the structure of our brain, more specifically its asymmetry. The functional differences in the right and left brain hemispheres are believed to underline the phenomenon of hand dominance.

Handedness is

probably the most obvious manifestation of the fact that our brain functions in an asymmetric manner.

brain captured the imaginations of researchers because it would be so useful (so easy, so non-invasive, so cheap) to study patterns of brain asymmetries by using a person's handedness as a marker for brain lateralization (direct methods involve neurosurgery, invasive drug testing, or expensive imaging techniques).

Brandler and  
Paracchini suggest the  
same mechanisms that  
determine left/right  
asymmetry in the body  
(e.g. Nodal signaling

play a role in the  
development of brain  
asymmetry  
(handedness is an  
outward reflection of  
brain asymmetry for  
motor function).

Interestingly, effects of handedness on brain structure extend beyond the primary motor area of the hand: anatomical asymmetry of language regions also appears to vary according to handedness.

The planum temporale is a brain region within Broca's Area, and is thought to be the most asymmetric area of the human brain; with the left side having shown to be five times the size of the right in some individuals.

However in people who are left handed, this asymmetry has shown to be reduced

The brain asymmetry for spatial frequency processing underlies a related asymmetry in processing different components of visual form, with the left versus right hemisphere being specialized for processing local versus global levels of form (e.g., Sergent, 1982a; Van Kleeck, 1989). In a typical local-global stimulus, a large global
