Raw Water Cooled Marine Engine

Besides exposure to corrosive materials in the water, raw-water cooled engines suffered from another major drawback. They had a thermostat, just like all engines, but it was regulated at 145-150° F. This was done to minimize the possibility that salt in the salt water would separate out and crystallize inside the engine's cooling passages, with 160°F being the critical turning point for this to occur.

Understanding the raw water cooling system of your boat's diesel engine will help you keep her running cool. Keeping your marine diesel engine running cool is explained here: From the raw water inlet through the seacock, the strainer, and the heat exchanger and then out the the wet exhaust, water from outside the boat circulates to keep the engine coolant cool.

Marine Diesel Engines, Part 1 | Raw Water Cooling System

In a raw water system the water is drawn up through the seacock by the water pump. The water flows through the engine and directly out the exhaust. This cooler water absorbs heat from the engine to help keep it cool. Most newer marine engines use an enclosed cooling system.

Engine Cooling Systems Explained - Boat Safe

The term "Fresh Water Cooling" also termed "Closed Cooling" can be confusing as compared to Raw Water or Open Cooling Systems, as these closed systems circulate antifreeze and not water. Marine Fresh Water Cooling systems are similar to the cooling system in an automobile however rather than a radiator they utilize a heat exchanger, and rather than using air to remove the heat generated by the engine they use lake or ocean water.

Fresh Water/Raw Water Cooling Kits - Marine Parts Express

As for the circulating water in closed cooling system, cool water will enter the engine through the circulating pump and circulate through the engine. Hot water will exit at the water outlet on top of the manifold and head to the heat exchanger to exchange the heat it's carrying with the raw water.

Marine Closed "Freshwater" Cooling Systems

These fresh water cooling system (s) will convert the currently functioning specified marine from a raw water cooled application to a fully functional fresh water cooled (closed cooling) half or full system, as specified in the kit detail. A full system cools the engine block and exhaust manifolds with coolant.

MerCruiser Fresh Water Cooling Conversion Kits

On a FWC equipped engine, raw-water can still enter internally into the engine or transmission through raw-water cooled oil coolers. Raw-water can also get into the engine jacket through the main heat exchanger, as well as, enter the engine cylinders through leaky raw-water-cooled exhaust manifolds and exhaust elbows.

The coolant leaves the heat-x at 155F to return to the engine, and the sea water warms up to 85F on its way downstream in the system. And the cycle just keeps repeating while all is working correctly. All of these engines also have a seawater pump and usually have a transmission/gear oil cooler.

The Benefits of Fresh Water Flushing your Marine Diesel Engine

Once the engine temperature rises, the thermostat will open and close as required to let the raw water move around the engine to cool it down (and this is the area we want to descale the most). Cooling water using the bypass with the thermostat closed
